8. The Late Waiver Workflow
9. The Monthly Late Summary Report
10. Troubleshooting & FAQ

1. Introduction

The Attendance Late Tracking & Deductions module extends the standard Odoo Attendance app so that every check-in is automatically measured against the office start time. When an employee arrives after their allowed grace window, the record is flagged as late, the lateness is shown in a clear H:MM format, and — once the monthly free quota is used up — a salary deduction is calculated automatically.

The module is designed for organisations that need a fair, transparent and configurable late policy without manually reviewing every attendance line. It supports single and split shifts, per-department rules, public holidays, alternate half-day Fridays, and a manager-approved waiver workflow for genuine exceptions.

1.1 Who Should Read This Manual

- **HR Managers** – configure office hours, grace limits, deduction slabs and approve waiver requests.
- **HR Officers / Administrators** – review late records, enter late reasons and generate the monthly summary.
- **Employees** – understand how lateness is measured and how to raise a waiver request for their own record.

1.2 Key Capabilities

- Configurable office start time – company-wide or per department.
- Late threshold (grace minutes) before a check-in counts as late.
- Monthly grace quota – a number of free late occurrences per month, per session.
- Two deduction modes – fixed slab amounts or automatic hourly-wage calculation.
- Single and split shift support, each session tracked independently.
- Working-days calendar and public holiday register.
- Alternate half-day Friday handling.
- Late-reason capture and a manager-approved waiver workflow.
- Monthly late summary report with grouping and filtering.

Before you begin

This module depends on the standard Odoo Attendance (hr_attendance) and Employees (hr) apps. Make sure both are installed and that employees have a Timezone set on their record — lateness is always calculated in the employee's local time.

2. Core Concepts

A few terms appear throughout this manual. Understanding them first makes the configuration screens much easier to follow.

Term	Meaning
Session	A continuous work period in a day. A single shift has one session; a split shift has two (for example morning and afternoon).
Late Threshold	The number of minutes after the session start time that are allowed before a check-in is marked late. Default is 15 minutes.
Grace Late Times	The number of late occurrences per month that are free of any deduction. Counted separately for each session.
Late Sequence	The running count of an employee's qualifying late occurrences in the month. Sequence 1 is their first late of the month.
Deduction Slab	A band of late minutes mapped to a fixed deduction amount, used in Fixed deduction mode.
Waiver	A manager-approved exception that sets the deduction on a specific late record to zero.

2.1 How Lateness Is Measured

For every check-in the module performs these steps:

1. It identifies which session the check-in belongs to, based purely on the clock time.
2. It looks up the start time for that session from the configuration that applies to the employee.
3. It adds the late threshold to the session start time to get the allowed arrival time.
4. If the check-in is later than the allowed arrival time, the record is marked **Is Late** and the lateness in minutes is recorded.

Example

Session 1 start: **9:00** • Late threshold: **15 minutes**

An employee who checks in at 9:10 is **on time** (within the 15-minute threshold).

An employee who checks in at 9:25 is **late by 25 minutes** — lateness is measured from 9:00, not from 9:15.

2.2 How the Grace Quota Works

Each session keeps its own independent grace counter for the month. If the grace quota is set to 5, the first five qualifying late occurrences in a session are recorded but carry no deduction. From the sixth occurrence onward, a deduction is calculated.

Only the first late check-in of a session on a given day counts towards the sequence. If an employee checks in late, checks out, and checks in late again in the same session on the same day, only the first occurrence is counted — the rest carry no additional deduction.

Split shift behaviour

In a split shift, Session 1 and Session 2 each have their own grace counter. With a grace of 1, the first Session 1 late and the first Session 2 late of the month are both free. The deduction begins from the second qualifying late in either session.

3. Navigating the Module

After installation, all features live under the Attendances app. Open Attendances > Late Tracking to find the module menu.

Menu	Purpose	Typical User
Late Records	List of all qualifying late attendance records.	HR Officer / Manager
Monthly Summary	Generate a per-employee late summary for a chosen month.	HR Officer / Manager
Waiver Requests	Review and approve or reject employee waiver requests.	HR Manager
My Waiver Requests	Raise and track your own waiver requests.	All employees
Configuration > Office Hours & Working Days	Define shifts, start times, grace and deduction mode.	HR Manager
Configuration > Deduction Slabs	Define fixed deduction bands by late minutes.	HR Manager
Configuration > Public Holidays	Maintain the public holiday calendar.	HR Manager

Visibility note

The Waiver Requests menu is restricted to HR Managers and system administrators. Regular employees see only My Waiver Requests. The Configuration submenu is intended for HR Managers.

4. Configuration: Office Hours & Working Days

This is the central configuration screen. Each configuration record defines the late policy for a company, or optionally for a single department within that company.

Open Attendances > Late Tracking > Configuration > Office Hours & Working Days. The module ships with one default company-wide configuration that you can edit, or you can create additional records for specific departments.

4.1 Scope

Field	Description
Company	The company this configuration applies to. Required.
Department	Leave empty for a company-wide rule. Set a department to create a rule that applies only to that department's employees.

How a configuration is chosen for an employee

The module first looks for a configuration that matches both the employee's company and department. If none is found, it falls back to the company-wide configuration (no department set). If still none is found, built-in defaults apply (9:00 start equivalent values, 15-minute threshold, grace of 5).

4.2 Late Settings

Field	Description	Default
Late Threshold (Minutes)	Minutes after session start before a check-in is marked late.	15
Grace Late Times / Month	Free late occurrences per month, per session, before deductions apply.	5

4.3 Shift Type and Office Hours

Choose the Shift Type, then fill in the session start and end times.

- **Single Shift** – one continuous work period. Only Session 1 times are used.
- **Split Shift** – two work periods with a break in between. Both Session 1 and Session 2 times are used, and lateness is checked at the start of each session.

Field	Description
Session 1 Start / End	Start and end time of the first work period, in 24-hour format.
Session 2 Start / End	Start and end time of the second work period. Shown only when Shift Type is Split Shift.
Daily Work Hours	Automatically calculated from the session times. Used by the hourly

Field	Description
	deduction mode.

4.4 Deduction Mode

Two modes are available for calculating the deduction amount once an employee is past their grace quota.

Fixed Amount (Slab-based)

The deduction is read from the Deduction Slabs table. The number of late minutes is matched to a slab band, and that band's fixed amount is applied. See Section 5 for setting up slabs.

Hourly Wage Calculation

The deduction is calculated automatically from the employee's wage. The hourly rate is derived as:

hourly rate = monthly wage ÷ working days in month ÷ daily work hours

Each started hour of lateness counts as one full hour of deduction. The working days in the month are calculated automatically from the Working Days configuration and the public holiday calendar.

Worked example – hourly mode

Monthly wage 30,000 • 26 working days • 10 daily hours

Hourly rate = 30,000 ÷ 26 ÷ 10 = **115.38**

Late 45 minutes → 1 started hour → deduction **115.38**

Late 65 minutes → 2 started hours → deduction **230.77**

Wage source

Hourly mode looks for the employee's wage first on a running contract, then on the Wage field of the employee's Payroll tab. If no wage is found, the deduction falls back to the matching fixed slab amount so HR still receives a value rather than a silent zero.

4.5 Working Days

Tick the days of the week that are working days. These are used to decide whether a given date counts for lateness and to calculate the working days in a month for hourly deductions. By default Monday to Saturday are working days and Sunday is not.

4.6 Half-Day Friday Settings

Some organisations treat certain Fridays as half-days with a later start time. Enable this section to apply a different start time on selected Fridays of the month.

Field	Description
Enable Half-Day Fridays	Turns the half-day Friday logic on or off.
Half-Day Friday Positions	Comma-separated positions of the Fridays that are half-day. For example, 2,4 means the 2nd and 4th Friday of every month.
Half-Day Start / End Time	The office hours that apply on a half-day Friday.

Changes recalculate automatically

When you save a change to any rule-affecting field — start times, threshold, grace, deduction mode, working days or half-day Friday settings — the module automatically recalculates the affected attendance records for the recent period. You do not need to edit each record manually.

5. Configuration: Deduction Slabs

Deduction slabs define how much is deducted for a late occurrence in Fixed deduction mode. Each slab is a band of late minutes mapped to a fixed amount. Open Attendances > Late Tracking > Configuration > Deduction Slabs.

5.1 Slab Fields

Field	Description
Company	The company the slab applies to.
Late From (Minutes)	The minimum late minutes for this slab, inclusive.
Late To (Minutes)	The maximum late minutes for this slab, inclusive. Set to 0 for an unlimited upper bound.
Deduction Amount	The fixed amount deducted for any late occurrence that falls within this slab.
Slab Name	Generated automatically from the From and To values, shown in H:MM format.

5.2 Default Slabs

The module ships with two default slabs that you can edit or replace:

Late From	Late To	Deduction Amount
15 min	60 min	100.00
61 min	Unlimited	250.00

Slab rules

The To value of a slab must be greater than its From value, or 0 for unlimited. Slabs are evaluated in ascending order of their From value, so design your bands so they do not overlap. If a late duration does not fall in any slab, the deduction is zero.

6. Configuration: Public Holidays

The public holiday register tells the module which dates are not working days, even if they fall on a configured working weekday. Holidays are excluded from lateness checks and from the working-days count used in hourly deductions. Open Attendances > Late Tracking > Configuration > Public Holidays.

6.1 Adding a Holiday

5. Click New.
6. Enter the Holiday Name, for example New Year's Day.
7. Select the Date.
8. Confirm the Company. It defaults to your current company.
9. Save the record.

One holiday per date

Each date can have only one holiday record per company. Attempting to add a second holiday for the same date and company is blocked automatically.

7. Working with Late Records

Once configuration is complete, the module works in the background. Every check-in created through the backend, the Kiosk mode, the mobile app or an import is evaluated automatically.

7.1 The Late Records List

Open Attendances > Late Tracking > Late Records to see all qualifying late occurrences. The list shows the late information added by this module alongside the standard attendance columns.

Column	Meaning
Is Late	Whether this check-in was flagged as late.
Late Time	The lateness shown in H:MM format, for example 1:05 for sixty-five minutes.
Session	Which session the check-in belongs to — Session 1 or Session 2.
Half Day	Whether the date is a configured half-day Friday.
Late Reason	The reason recorded for the lateness, if any.
Late #	The late sequence number in the month for that session.
Deduction Amount	The calculated deduction. Zero while the employee is within grace or if the record is waived.
Waived	Whether an approved waiver has set the deduction to zero.
Daily Total Hours	Total worked hours for the employee on that day across all check-ins.

7.2 Searching and Grouping

The Late Records view provides ready-made filters and grouping options:

- **Filters** – Late Only, On Time, Half Day, With Deduction, No Deduction, Has Reason, Missing Reason.
- **Group By** – Employee, Department, Date or Month.

A common task is to find late records that are still missing a reason: apply the Missing Reason filter and group by Employee.

7.3 The Attendance Form

Opening any attendance record shows a Late Tracking section with all the calculated fields. The important read-only fields are Session, Expected Start Time, Is Late, Late Time, Late # in Month, Deduction Amount and Waived. The Late Reason field can be edited here, or filled through the popup described in the next section.

7.4 Entering a Late Reason

When an attendance record is late and has no reason yet, a yellow Enter Late Reason button appears on the form. HR officers use this to record why an employee was late.

10. Open the late attendance record.
11. Click the Enter Late Reason button.
12. In the popup, review the employee name, late duration, session and current deduction.
13. Type the reason in the Late Reason field. It is required.
14. Click Save. The reason is written back to the attendance record.

Reasons do not change the deduction

Recording a late reason is for documentation only. It does not by itself remove or reduce the deduction. To remove a deduction for a genuine exception, use the waiver workflow described in Section 8.

7.5 Check-Out and Re-Entry Rule

Once an employee checks out of a session for the day, that session is closed. They cannot check in again to the same session on the same day, although they can still check in to the other session in a split shift. When you fill the Check Out field on the form, a confirmation warning explains this. The form also provides a Check Out Now button that opens a confirmation wizard with explicit Cancel and confirm options.

8. The Late Waiver Workflow

A waiver is a manager-approved exception. When a waiver is approved, the deduction on the linked late record is set to zero. The record still appears in reports, clearly marked as waived, so the history stays transparent.

8.1 Waiver States

State	Meaning
Draft	The request is being prepared by the employee and can still be edited.
Pending Approval	The request has been submitted and is awaiting a manager decision.
Approved	A manager approved the request. The linked attendance record is now waived with zero deduction.
Rejected	A manager rejected the request. The deduction stands. The employee can reset it to draft and resubmit.

8.2 Raising a Waiver Request (Employee)

Open Attendances > Late Tracking > My Waiver Requests and follow these steps:

15. Click New.
16. Confirm your name in the Employee field.
17. **Select the Late Attendance Record.** Only your own qualifying late records are listed.
18. Review the auto-filled late date, check-in time, late duration and current deduction.
19. **Enter the Reason for Waiver.** Explain why the deduction should be waived, for example an office errand or a client visit that ran late.
20. Click Submit for Approval. The request moves to Pending Approval and your manager is notified.

One waiver per record

Each late attendance record can have only one active waiver request. If a request already exists for a record and is not rejected, you cannot create a second one for the same record.

8.3 Approving or Rejecting a Waiver (Manager)

Open Attendances > Late Tracking > Waiver Requests. The view opens filtered to pending requests.

21. Open a request in the Pending Approval state.
22. Review the late record details and the employee's stated reason.
23. **To approve:** click Approve Waiver. The linked attendance record is marked as waived and its deduction becomes zero.

24. **To reject:** click Reject. The deduction on the attendance record stands, and any previously set waiver flag is removed.

Both actions record who made the decision and the date. A rejected request can be reset to draft by the employee and resubmitted with additional context.

9. The Monthly Late Summary Report

The monthly summary aggregates qualifying late occurrences per employee for a chosen month. It counts only late occurrences that fall past the grace quota, so the figures reflect the deductible lateness.

9.1 Generating the Summary

25. Open Attendances > Late Tracking > Monthly Summary.
26. Select the Month and Year.
27. **Optionally narrow the scope:** choose a Department, or pick specific Employees.
28. Click Generate Summary. The result opens as a list.

9.2 Reading the Summary

Column	Meaning
Employee / Department	The employee and their department.
Total Late Days	The number of qualifying late occurrences past the grace quota in the month.
Total Late (Minutes)	The sum of late minutes across those occurrences.
Total Late Time	The same total shown in H:MM format.
Total Deduction	The sum of deductions for those occurrences.

Summary is rebuilt each time

Generating the summary clears the previous result and rebuilds it from current data. Always regenerate after late records, reasons or waivers have changed.

10. Troubleshooting & FAQ

10.1 Common Questions

Question	Answer
An employee is flagged late but the deduction is zero. Why?	The employee is still within their monthly grace quota for that session, or the record has an approved waiver. Both correctly produce a zero deduction.
The lateness in minutes looks wrong.	Check the employee's Timezone on their record. Lateness is calculated in the employee's local time. Also confirm the correct configuration is being applied — department rules override company-wide rules.
A second late check-in on the same day was not deducted.	Only the first late check-in of a session per day counts towards the sequence. Subsequent same-session check-ins on the same day carry no additional deduction by design.
Hourly deduction came out as zero.	No wage was found on a contract or on the employee's Payroll tab, or the daily work hours are zero. The module falls back to the fixed slab amount when this happens.
I changed the configuration but old records still show old values.	Saving a rule-affecting change triggers an automatic recalculation of recent records. If a very old record needs updating, re-saving it forces a fresh calculation.
An employee cannot check in again after checking out.	This is intended. Once a session is checked out for the day it is closed. The employee can use the other session in a split shift, or check in again the next day.

10.2 Good Practice Checklist

- Confirm every employee has a Timezone set before going live.
- Review the default office hours, threshold and grace, and adjust them to your policy.
- Decide on Fixed or Hourly deduction mode and configure slabs or wages accordingly.
- Maintain the public holiday calendar at the start of each year.
- Encourage HR officers to record late reasons promptly using the Enter Late Reason button.
- Regenerate the monthly summary only after reasons and waivers for the month are settled.
